

Compact force-to-unit transfer in Qwen3-4B-Instruct

Attribution-guided TopK SAE panel and frozen swap-in confirmation

A Attribution-guided feature panel

B Frozen causal confirmation

ACTIVATION DONORS

Interpretation: the frozen panel produced a selective logit shift, not a token flip. Its force-source effect was 40.6% of the full-latent swap effect. Effect ratios are intervention comparisons, not variance explained.

Solid layer-28 arrows are retained graph edges. The dotted path compresses unshown graph nodes; the diagram is an evidence summary rather than a complete computational circuit.
